Why Organic Gardening is Good for the Environment

Organic Soil Keeps Our Underground Water Clean and Safe

Soil is everything.

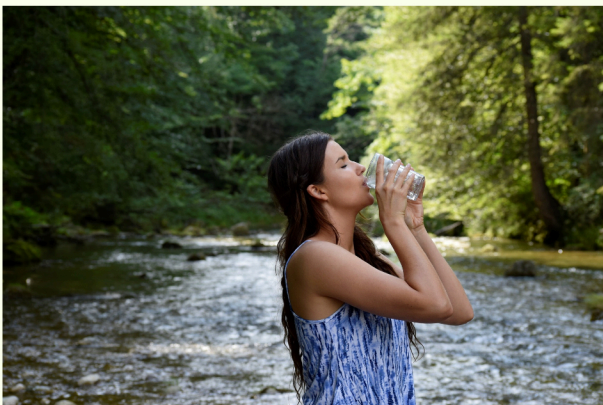

Soil contaminated with chemical fertilizers and pesticides will pollute our underground water - **the source of our drinking water.**

By keeping the earth's surface safe and healthy, we can keep our drinking water pure and delicious.

Chemical Fertilizer and Pesticides Pollute the Underground Water

When the soil is contaminated, waters underneath it will be contaminated.

Have you seen **smelling bad, murky water**? You will see such water when the soil is polluted with something bad.

Organic Gardening Doesn't Pollute the Land and Keeps Our Drinking Water Safe and Delicious.
