

# Why Capturing Rainwater is Good for the Environment

Water Evaporates and forms  
Clouds.

The clouds fall back on to ground in  
the form of rain/ snow/ storm/  
hurricane.

Today, due to the global warming,  
ices and glaciers around the world  
have melted and the mass of water  
increased on the earth.

With heat, they evaporate and form  
bigger and thicker clouds, so-called  
"Atmospheric River."

The Atmospheric River brought flash  
flood, topical dounpour of rain and  
snow, and high wind and tide to  
innundate the costal and riverside  
cities.

**Capturing Rainwater in Rain Barrels and  
Cisterns will Help Delay the Overflow of  
Sewage Water in times of flood.**
